

DGprofessional™ – Data Steward Services

Analyze, clean up, classify, and migrate data chaos

Typical Use Cases

- Create a centralized inventory of millions of unstructured data points in hybrid environments (traditional file storage, M365 Cloud)
- Identify data owners and create an organizational view
- Clean up, delete, and archive large volumes of data; eliminate versions and duplicates
- Verify compliance with requirements such as security standards, regulations, and governance policies
- Evaluate problem areas and opportunities for optimization; determine causes and responsible parties
- Identify sensitive data objects
- Review and correct access permissions
- Reclassify and label large volumes of data objects
- Prepare, clean, organize, and migrate data for traditional file systems to Microsoft 365

For years, companies have been struggling with exponentially growing volumes of unstructured data, such as files, emails, and attachments. Responsibilities are often unclear, and governance rules are rarely enforced. This gives rise to security, compliance, and data protection risks. Redundant and obsolete data (ROT data) is piling up, which hinders user productivity and leads to high costs. Regulatory requirements, data protection, security standards, and migration projects to Microsoft 365 and other clouds are forcing companies to analyze, classify, and clean up their legacy data.

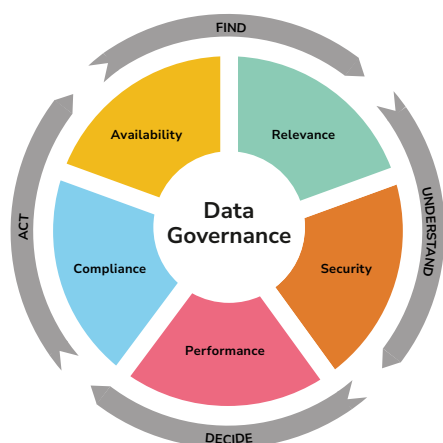

Clean up millions of contaminated sites

Who is responsible? Who does it? How?

Lifecycle and data management initiatives often fail due to a lack of transparency, unclear responsibilities, a lack of automation, and insufficient support from the company. However, the involvement of data owners and users is crucial to success. These individuals often lack experience, motivation, time, and efficient tools. In most cases, they also no longer have any connection to legacy data. They are afraid of accidentally deleting business-critical information.

This is where we step in with our DGprofessional™ Services. We advise companies, conduct data assessments, identify problem areas and opportunities for optimization, determine the causes and sources of deficiencies, develop cleanup, migration, and remediation strategies, and support the projects.

Based on our products, we also offer Data Steward Services and take the burden off companies when they lack sufficient resources and expertise.

DGprofessional™ – Data Steward Services

Analyze, clean up, classify, and migrate data chaos

We bring order to data chaos and help implement regulatory requirements, security standards, and data protection quickly and efficiently.

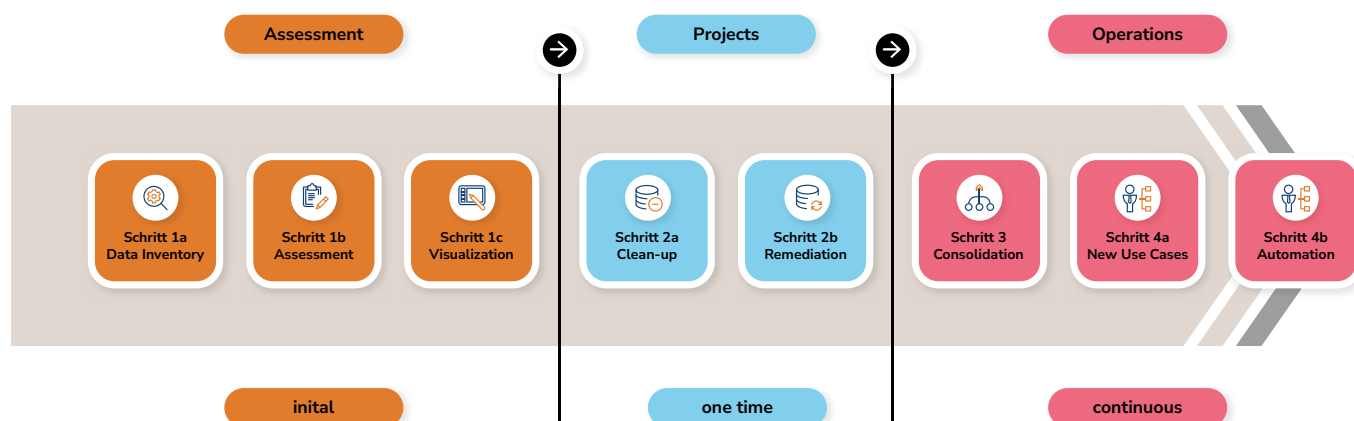

Our team has developed a standardized process model and established best practices for various use cases, which we have implemented in our Data Go-

vernance Platform. The focus is on involving the various roles, automating tasks as much as possible, reducing any workload for the organization's employees, and enabling decision-makers to make well-informed decisions. Thanks to our unique, integrated platform, we do this 10 times more efficiently and with higher quality.

Standardized Process Model for Complex Projects

With DGprofessional™ Data Steward Services, we rely on a standardized process model that is flexibly adapted to the requirements of each specific use

case. Proven best practices, clear responsibilities, and a high degree of automation ensure efficient and traceable results.
